

Kusari Platform Know Your Software

The Kusari Platform delivers transparency and insights, making your software development more secure, efficient and reliable.

Don't wait until after the build—or worse, a breach—to ensure applications are secure. Instead, know artifacts before they are introduced. Protect every software component from the moment it's introduced. Track attributes, relationships, and posture through each stage of development. Easily share those outcomes with departments that need to know.

With the Kusari Platform and our powerful graph analytics, you can:

- Pinpoint dependencies and understand the blast radius of issues in seconds, not days
- Prioritize risks and fix issues fast
- Continuously track, update, and correlate with other services
- Uncover license issues for hassle-free compliance
- Integrate with existing tools so there's no developer disruption
- Store, augment and manage all your software metadata

Key Features

Kusari Score

Rank issues based on CVSS score and reach; configurable to organization tolerances

Kusari Effort to Fix

Prioritize how significant and far-reaching an issue is to upgrade

Kusari AI

Use powerful graph analytics and LLMs to easily query your software environment for critical information

Timeline View

Obtain context for each issue, prioritize the next action to take, and identify where impacts are likely to surface

Deployment Insights

Map deployments across Dev, Preview, and Prod; track images from code to runtime

Kusari Platform Benefits

Complete transparency of all your dependencies

Using Kusari's graph technology, understand how and where dependencies and vulnerabilities are affecting your software (direct or transitive). Visualize problems, attribute projects to stakeholders, and define a remediation path.

Intelligence to prioritize, make better decisions, reduce risk and noise

Out of the box, Kusari ranks and prioritizes issues, providing context and actionable insights to improve software health and quickly reduce exposure. With eBPF runtime analysis, detect if vulnerable packages are truly in use, sharpening focus on exploitable risks and automating VEX generation.

Start simple, scale fast

Kusari is cloud-based SaaS, connects with all tools in your supply chain (just as they are), and provides updates as your codebase, tools and processes evolve.
